

## Support pliers with square jaws, opening 50 mm

**Laboratory forceps** are simple tools commonly used in the chemical laboratory. They are normally used to move or support glassware that is brought to high temperatures by direct heating or for the occurrence of exothermic chemical reactions inside it, as well as in all situations in which the direct use of hands is not recommended, such as for example in case of treatment of corrosive substances.

Made of light alloy, painted with heat and acid resistant paint.

Squared branches lined with PVC or cork to ensure greater grip.

With free shank or swiveling clamp (maximum clamp opening: 16 mm)

Suitable for supporting refrigerant tubes and flasks.
