

Klemmer hemostatic forceps, in stainless steel, straight, length 200 mm

The vascular clamp, also known as the hemostatic forceps, is a surgical hemostatic forceps used in virtually all surgical procedures for the hemostatic closure of a blood vessel.

It consists of two beaks that close the blood vessel. The jaws are kept closed by a rack and by pressing on the handle they close by tightening.

By pressing down with your thumb and pulling with your index finger, the clamp opens.

Made of stainless steel, straight, available in different lengths.
